2) Notice of Draftsperson's Patent Drawing Review (PTO-948) 3) Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08) Paper No(s)/Mail Date 04/20/2006. Paper No(s)/Mail Date 04/20/2006.						

DETAILED ACTION

1. This communication is responsive to the applicant's amendment dated 02/02/2006.

Response to Arguments

2. Applicant's arguments with respect to claims 1, 5, 7, 17, 18, 36, and 38 have been considered but are most in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1, 5, 7, 17, 18, 36, and 38 rejected under 35 U.S.C. 103(a) as being unpatentable over Martin (US Patent 5,796,848) in view of Arndt et al (US Patent 6,421,448, hereafter, Arndt).

Regarding Claims 1 and 5, Martin discloses a microphone assembly of a hearing aid comprising a microphone assembly casing (6) having a sound inlet port (15), a transducer for receiving acoustic waves through the sound inlet port (1), and for converting received acoustic waves to analog signals (18), said transducer being positioned within the microphone assembly casing, an electronic circuit positioned

within the microphone assembly casing, said electronic circuit comprising a signal path defined by a cascade of a pre amplifier (8) for amplifying analog audio signal from the transducer, and a sigma-delta modulator for providing digital signals (7). Martin does not disclose the microphone assembly further comprises filter means in the signal path between the pre-amplifier and the sigma-delta modulator to prevent low frequency components from reaching the sigma-delta modulator.

Arndt discloses an audio device having a microphone assembly (Figs. 1 and 2) with a transducer pre-amplifier and analog and digital signal processing unit 5 (A/D converter) including a high pass filter means (3) in the signal path between the pre-amplifier (12) and the digital signal processing unit 5 to prevent low frequency components from reaching the digital signal processing unit; and for limiting the frequency band of the input signals and suppress interference signals of lower frequency (col. 2, lines 5-48). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include a high pass filter means in the signal path between the pre-amplifier and the sigma-delta modulator of Martin to prevent low frequency components from reaching the sigma-delta modulator in order to pass only desired signal components to the sigma-delta modulator (A/D converter) for more efficient processing by filtering out undesired signals, and for limiting the frequency band of the input signals and suppress interference signals of lower frequency.

Regarding Claims 7 and 38, it is well known in the art that circuits can be formed on integrated circuits to create a smaller circuit. Therefore it would have been obvious

to one of ordinary skill in the art at the time the invention was made to form the circuit on an integrated circuit in order to create a more compact circuit for a small electronic device such as hearing aid as shown by both Martin and Arndt. And Martin further discloses the device is integrated on a monolithic integrated circuit (see Martin Claim 9).

Regarding Claim 17, Martin further discloses the microphone assembly 6 is connected to a signal processor, which inherently teaches a digital signal processor as the signal was converted to a digital signal prior in the A/D converter 7.

Regarding Claim 18, Martin further discloses the unit as a digital hearing aid (abstract). And Arndt's device is also a hearing aid.

Regarding Claim 36, the high pass filter means of Arndt had an upper critical frequency of 100 Hz (Col. 4, line 20-col. 5, line 28) that inherently is a filter for passing a frequency band.

Conclusion

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Xu Mei whose telephone number is 571-272-7523. The examiner can normally be reached on Monday-Friday (9:30-6:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Vivian Chin can be reached on 571-272-7848. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
